Sample Analyzed for DOMVR in the Commission II of the ICCP

Insert a microscopy image of the sample with graphic scale

Insert the distribution of vitrinite reflectance means

Sample Information	
Code: DOMVR#15	Year of Analysis: 2006-2016
Type of Sample: Well sample	
Location and/or Fm.: Berwynda	ale South-10, 523.59m. /Walloon Coal Measure
Country: Australia (Qlo	d) Age (Period): Mid Jurassic
Dep. Environment: Terrestrial	
Coordinates Long.	Coordinates Lat.
ICCP WG: DOMVR Accreditation Programme	
Convenor: Alan Cook/Angeles G. Borrego	-mail: angeles@incar.csic.es
Exercise Information Report: DOMVR updated report Participants N: Group Mean (VRr%) 0.440 Group Stdv.: 0.07 Averaged Unsigned Multiple Stdv.: 0.79 Coef. of Variation: 16.1 Scattering Index: 0.000	☐ Macerals ☐ Geochemistry ☐ Images available Others (indicate in

Sample provided by Peter Crosdale. Suberinite-rich sample in which suberinite often has a massive appearance where the walls are packed together and exhibit weak fluorescence. No doubt that the outliers have measured suberinite as vitrinite. Overall clear modal values with low scatter in the results.

Comments:

Sample Analyzed for DOMVR in the Commission II of the ICCP

LEGEND

<u>Code:</u> refers to the sample code as distributed for the round robin exercises

ICCP WG: name of the WG in which the exercise was run

<u>Microscopy images:</u> Please indicate in the image as much information as possible regarding illumination conditions and identification of components. If you use fluorescence and white light images. Insert them as a single image.

<u>Histogram with reflectance readings:</u> Please build up an histogram with the individual vitrinite reflectance means reported by participants to represent the scatter of the readings in the exercise

<u>Report:</u> indicate the name of the report in which the results of this sample are available as recorded in the webpage (i.e. Bostick 1982; Borrego 2006, etc...)

Participants N: number of results included in the exercise

Group mean (VRr %): refers to the group mean resulting of averaging the individual mean reflectance values reported by participants.

Group Stdv: refers to the group standard deviation resulting from the individual mean reflectance values reported by participants.

<u>Averaged Unsigned Multiple Stdv.</u>: refers to the Average value of the individual Unsigned Multiple of the Standard Deviations, calculated for each participant against the group mean and group standard deviation data. This statistical is used in the ICCP Accreditation Programms to assess the precision of the participants. Average Unsigned Multiple Stdv.=Summa(absolute value [participant VRr-Group Mean)/Group Stdv.])

<u>Coefficient of Variation</u>: allows comparing the dispersion of results regardless the value of the mean. Coefficient of variation=Group Stdv *100/ Group Mean.

<u>Scattering Index</u>: allows an estimation of the reliability of the values based on the Coefficient of Variation and the number of participants. Scattering Index=Coefficient of Variation/N of participants

<u>Comments:</u> Please indicate whatever information you consider relevant. Information to include is: objectives of the working group, indication about fluorescence properties, abundance of vitrinite particles to be measured, difficulties in sample preparation or polishing, possibility of suppressed values, the main conclusions about the characterization of the samples.
